# The Application of R-Matrix Analysis to Experimental Data

#### 1 - Resonance Properties

#### Alex Murphy & David Mountford

#### Contents

- The R-Matrix Formalism
- Context: The  ${}^{18}F(p,\alpha){}^{15}O$  Reaction
  - (Doing an...) R-Matrix analysis
  - Comparison of R-Matrix Codes
  - Conclusions

#### Some Theory...

- "Bible": Lane and Thomas, Rev. Mod. Phys. 30, 257 (1958)[1]
- Basics: split system into internal and external regions:

- R-Matrix radius ~ nuclear radius, slightly larger
- Various incoming "channels"

#### Internal Region:

- Wavefunction not well understood, cannot obtain cross section...
  - Radial and spherical contributions
  - Set of orthonormal basis functions

$$\Psi = \sum_{c} \psi_{c} \phi_{c} = \sum_{\lambda} C_{\lambda} \chi_{\lambda}$$

• Calculating coefficients and solving Schrodinger equation:

$$\phi_{c} \left(\frac{\hbar^{2}}{2\mu_{c}r_{c}}\right)^{\frac{1}{2}} = \sum_{\lambda} \left(E_{\lambda} - E\right)^{-1} \sum_{c'} \left(\frac{\hbar^{2}}{2\mu_{c'}r_{c'}}\right)^{\frac{1}{2}} \gamma_{\lambda c} \gamma_{\lambda c'} \left[\rho_{c'}\phi'_{c'} - \phi_{c'}b_{c'}\right]$$

- Purely radial
- All spherical dependence absorbed by  $\gamma$
- Extract "R-matrix":

$$R_{cc'} = \sum_{\lambda} \frac{\gamma_{\lambda c} \gamma_{\lambda c'}}{E_{\lambda} - E}$$

- External Region:
  - Purely Coulomb potential

Radial wavefunction is well understood combination of well known
 Coulomb functions:

$$\phi_{c} = \frac{1}{\sqrt{v_{c}}} \left( A_{c}I_{c} - \sum_{c'} U_{cc'}A_{c'}O_{c} \right)$$
$$I_{c} = \left( G_{c} - iF_{c} \right) e^{i\omega_{c}}$$
$$O_{c} = \left( G_{c} + iF_{c} \right) e^{-i\omega_{c}}$$

- $U_{cc'}$  = scattering matrix
- Substitution into internal wavefunction gives scattering matrix in terms of R-matrix:

$$U = \rho^{\frac{1}{2}}O^{-1}(1-RL)^{-1}(1-RL^*)I\rho^{-\frac{1}{2}}$$

To cross section:

– One U for every  $J^{\pi}$  group

$$\frac{d\sigma}{d\Omega} \propto \left| U_J U_{J'}^* \right|$$

- $U \sim e^{2i\delta}$ ,  $\delta = \text{total phase shift:}$  $\frac{d\sigma}{d\Omega} \propto \cos(2(\delta_J - \delta_{J'}))$
- $\delta = \text{phase of U}$
- Cross section calculated either directly from U or from phase shifts

# **R-Matrix Implementation** Simplified multi channel code (P. Descouver, pt): $\frac{d\sigma}{d\Omega} \propto \cos(2(\delta_J - \delta_{J'}))$

#### Experimental Work

# $^{18}F(p,\alpha)^{15}O$

#### Motivation

- <sup>18</sup>F is the dominant gamma-ray emitter in novae
- Abundance strongly dependent on rate of this reaction
- Reaction proceeds through poorly known resonances in <sup>19</sup>Ne
  - Theoretical expectation of additional states

#### Need to find and characterise states in <sup>19</sup>Ne

- Pure, intense <sup>18</sup>F beam
- 'Thick' CH<sub>2</sub> target
- <sup>18</sup>F stopped in target
- Adjust beam energy & target thickness for desired *Ecm* coverage
- Protons and alpha particles detected downstream in DSSDs

Simultaneous excitations functions of <sup>18</sup>F(p,p)<sup>18</sup>F & <sup>18</sup>F(p,α)<sup>15</sup>O

<sup>19</sup>Ne

<	Η	1.571(13)	5/2+	1.7(4)	12(3)	

- Observed by Dalouzy (alternative π) and Murphy (alternative J)
- Dalouzy J unambiguous but π inferred
- Current data strongly favours J<sup>π</sup>=5/2<sup>+</sup> at consistent strengths

# **Dufour/Descouvemont State??**

- Candidate state observed at  $E_{CM} = 1.455 MeV (G)$
- More than a factor of 2
- *narrower* than predicted in proton channel
- More than a factor of 2 *broader* than predicted in alpha channel
- But consistent in total width (402(93)keV) with Dalouzy (292(107)keV
- Broad state <u>is required</u> to fit to data

# **Impact: Enhanced S-Factor**

- Low energy and sub-threshold parameters as in [3]
- Enhanced by prediction of [2]

# A bit more about the fitting...

#### Problems

- E Many parameter fit
  - 10 x statistics in (p,p) channel compared to (p,α)
  - Changing energy resolution

#### Energy Resolution

#### Solutions...

- Monte Carlo to estimate energy resolution
- dE(E) in (some) R-Matrix code
- **Complexity** •

#### **Statistics**

#### Iterative analysis

- Literature values
- Trial and error (by eye adjustments)
- Fitting single resonances
- Fitting multiple resonances
- Fitting multiple channels
- Fitting entire data set
- Play God
  - Initially adjust error bars to change weightings
  - Make active use of error matrix (covariance)

Include additional contributions to final error bars!

#### • Co-variance

	in the first of the finance many for an parameters and we do they in the mang process.

 <sup>6</sup>GSI Darmstadt, Planckstr. 1, 64291 Darmstadt, Germany (Received 11 January 2010; published 26 April 2010)

The paper describes a multilevel, multichannel R-matrix code, AZURE, for applications in nuclear astrophysics. The code allows simultaneous analysis and extrapolation of low-energy particle scattering, capture, and reaction cross sections of relevance to stellar hydrogen, helium, and carbon burning. The paper presents a summary of R-matrix theory, code description, and a number of applications to demonstrate the applicability and versatility of AZURE.

DOI: 10.1103/PhysRevC.81.045805

#### Conclusions

- R-matrix formalism extremely useful for extracting resonance parameters for astrophysical reactions
- New data obtained in study of astrophysically important  ${}^{18}F(p,\alpha){}^{15}O$  reaction
- Analysis, aided by R-Matrix calculations, finds candidate for newly proposed s-wave state

Enhanced rate of <sup>18</sup>F destruction → less <sup>18</sup>F → detectability distance reduced
